

# Surveillance Self-Defense

## Your Security Plan

### What do I want to protect?

*Make a list of your assets: data that you keep, where it's kept, who has access to it, and what stops others from accessing it.*

### Who do I want to protect it from?

*Make a list of your adversaries, or those who might want to get a hold of your assets. Your list may include individuals, a government agency, or corporations.*

### How bad are the consequences if I fail?

*Write down what your adversary might want to do with your private data.*

### How likely is it that I will need to protect it?

*Write down which threats you are going to take seriously, and which may be too rare or too harmless (or too difficult to combat) to worry about.*

### How much trouble am I willing to go through to prevent these consequences?

*Write down what options you have available to you to help mitigate your unique threats. Note if you have any financial constraints, technical constraints, or social constraints.*
